SCALPER PRO X

QUICK OVERVIEW

HOW IT WORKS

Scalper Pro X combines dynamic band structure, trend context, and signal logic to help traders review short-term market direction in a clearer and more structured way.

01

Scalper Pro X is an algorithm-driven indicator designed to highlight short-term trading opportunities across all timeframes.

02

The upper purple band helps show bearish pressure and potential resistance areas.

03

The lower cyan band helps show bullish pressure and potential support areas.

04

Buy and Sell labels appear when market conditions align with the indicator's internal logic.

05

The status panel gives fast context on trend, signal, power, strength, price position, alerts, and timeframe.

READING THE BANDS

SIGNAL STRUCTURE

1) Upper Band:

The purple upper zone can act as a short-term resistance or bearish pressure area.

2) Lower Band:

The cyan lower zone can act as a short-term support or bullish pressure area.

3) Middle Ribbon:

The inner ribbon helps show the active flow of price and short-term direction shifts.

5) Status Panel:

The panel summarizes current trend, signal bias, power, strength, price position, alerts, and the active timeframe.

4) Buy / Sell Labels:

These alert labels highlight areas where the indicator sees a structured setup.

WHAT TO LOOK FOR

Many users review how price behaves around the upper and lower bands, then use the signal labels and status panel as added structure before making their own decisions.

REVIEWING A SELL SETUP

PAGE
05

BEARISH EXAMPLE

1

The status panel shows Trend: DOWN and Signal: SELL, giving bearish context.

2

The Price: BELOW reading suggests price is holding on the weaker side of the indicator structure.

3

Sell labels often appear near areas where the indicator sees resistance or weakness around the upper band or inner ribbon.

4

Power and Strength fields help add quick context to the current setup environment.

5

The band structure can help traders review whether price is rotating lower from overhead pressure.

GUIDE NOTE

This example is designed to show how the indicator may be reviewed in a structured way. Traders should still apply their own judgement, risk controls, and broader chart analysis.

REVIEWING A BUY SETUP

BULLISH EXAMPLE

1 The status panel shows Trend: UP and Signal: BUY, giving bullish context.

2 The Price: ABOVE reading suggests price is holding on the stronger side of the indicator structure.

3 Buy labels often appear near areas where the indicator sees supportive conditions around the lower band or inner ribbon.

4 Power and Strength fields help add quick context to how active the move may be.

5 The band structure can help traders review whether price is bouncing from support and rotating higher.

GUIDE NOTE

This type of setup is often reviewed together with chart structure, price action, and personal trade management rules. Scalper Pro X is a chart-analysis tool and should be used with your own judgement.

ALL-TIMEFRAME WORKFLOW

BEST PRACTICE GUIDE

GBPUSD • 5m

BTCUSD • 15m

1

Choose a timeframe

Scalper Pro X can be reviewed on short, medium, or higher timeframes.

2

Review the status panel

Check trend, signal, power, strength, price position, and alerts.

3

Read the band context

Note whether price is interacting with the upper band, lower band, or inner ribbon.

4

Watch for alert labels

Buy and Sell labels can help highlight structured opportunity areas.

5

Add chart confirmation

Review price action, nearby levels, and overall market structure before acting.

6

Use your own risk plan

Apply your own trade management and decision-making process at all times.

Scalper Pro X is designed to make short-term chart review clearer and faster, while still leaving final decisions to the user.
